

Timely Turf

Tips

March 2021

The weather is warming up and that means maple syrup time. Want to learn more about the process of gathering sap and making syrup? Check out the MN Department of Natural Resources site, www.dnr.state.mn.us/state_parks/maple_syruping.html, to watch a video or click on additional links to learn more about the process. This could be a wonderful family event. See the folks at the mill if you decide to give it a try for tree tapping supplies.

March Reminders

Repot root-bound house plants now. Increasing length of day leads to new growth and pot-bound plants benefit with a larger pot. Use a pot 2" larger in diameter than the existing pot. At the end of this month, jump-start all indoor plants with a water-soluble fertilizer mixed at half strength. The mill has the potting soil and fertilizer needed.

Now is when Steve is preparing for the upcoming season. Make sure your favorite pepper and tomato plants will be available this spring. Call 651-429-3361 today and talk to Steve or email him at steve@hugofeedmill.com.

Time for spring cleaning of wood duck and bluebird houses. The mill has cedar shavings for wood duck house nesting material.

Seed Starting Basics

Soil: For very best results, use a sterilized soil or potting medium. Check the seed packet to determine the coverage needed for the type of seed planted. Stop by the mill to pick up a bag sterilized soil. See the coupon below to save on the purchase.

Light: Young seedlings will need about 14 hours of direct light a day. This may be the biggest challenge in starting seeds indoors. The sun will move past even the brightest window in a home, causing the seedlings to stretch towards the light and become leggy. Fluorescent lights work well because they emit very little heat and will not dry out the plants. Using a light timer set at 14 hours automates the task of controlling hours of light.

Water: Water enough to keep the potting mixture moist. Consider using a spray bottle to mist the soil or use a plastic dome or plastic wrap to keep the moisture in. Once the seeds germinate, loosen the plastic wrap (domes can be kept in place) and move the tray into bright light.

Hardening Off: Once the seedlings have grown, they will be ready to move outdoors when the temperatures warm. It's very important to get the seedlings used to being outside by hardening off. To do this, simply set the plants outside, out of direct sunlight for about an hour on a calm day. Increase this amount of time every day until the plants have stayed out all day. After about 10-14 days, the plants will be ready to go in the ground after the threat of frost has passed.

When to Start: To get more detailed information about how and when to start seeds, the University of Minnesota Extension has this helpful link: <https://extension.umn.edu/planting-and-growing-guides/starting-seeds-indoors>
